### Saving time for an automotive giant

A large manufacturer of vehicles turned to Scan2CAD to convert their images of part schematics to vector. Previously this was a largely manual and time consuming process.

With features such as Scan2CAD's batch conversion and automation the team were able to convert 1000's of files at once at the click of a button. This optimization of their processes saved them hundreds of man-hours a month which massively reduced costs.

### Recovering a microchip manufacture's designs

A microchip manufacturer had a large number of poor quality 'dirty' images which they needed to edit in their CAD application. Due to the poor quality of the image, they were manually tracing a vector version of the images.

The company turned to Scan2CAD. The application's intelligent image cleaning tools recovered the images with a few simple steps and provided clean conversions of their images which could be transferred to any CAD application.

### Helping save lives with precision tools

A design and manufacturing company for life saving devices chose Scan2CAD to transform their drawings to an editable vector format.

The company stressed the importance of precise vector conversion being true to the original images. With Scan2CAD they were able to achieve this. They also used the OCR function to convert and edit text in their images which they were previously redrawing.
